- ▶ Infinite Galois Groups
- ▶ Combining Group Theory and Number Theory Computations

# Notation

- ▶  $K$  – number field

# Notation

- ▶  $K$  – number field
- ▶  $p$  – rational prime (usually  $p = 2$ )

# Notation

- ▶  $K$  – number field
- ▶  $p$  – rational prime (usually  $p = 2$ )
- ▶  $S$  – finite set of primes of  $K$  none lying above  $p$

# Notation

- ▶  $K$  – number field
- ▶  $p$  – rational prime (usually  $p = 2$ )
- ▶  $S$  – finite set of primes of  $K$  none lying above  $p$
- ▶  $K^S$  – union of  $p$ -extensions of  $K$  unramified outside  $S$

# Notation

- ▶  $K$  – number field
- ▶  $p$  – rational prime (usually  $p = 2$ )
- ▶  $S$  – finite set of primes of  $K$  none lying above  $p$
- ▶  $K^S$  – union of  $p$ -extensions of  $K$  unramified outside  $S$
- ▶  $G$  –  $\text{Gal}(K^S/K)$

# Why We Care About $G$

- ▶  $p$ -class towers of historical importance (the case of  $S = \emptyset$ )

# Why We Care About $G$

- ▶  $p$ -class towers of historical importance (the case of  $S = \emptyset$ )
- ▶ Root-discriminant bounds: e.g. among totally complex  $K$ , how small can  $rd(K) := |Disc(K)|^{1/[K:\mathbf{Q}]}$  be? Under GRH,  $Liminf \geq 44$ . Record:  $Liminf \leq 82$  (Hajir-Maire).

# Why We Care About $G$

- ▶  $p$ -class towers of historical importance (the case of  $S = \emptyset$ )
- ▶ Root-discriminant bounds: e.g. among totally complex  $K$ , how small can  $rd(K) := |Disc(K)|^{1/[K:\mathbf{Q}]}$  be? Under GRH,  $Liminf \geq 44$ . Record:  $Liminf \leq 82$  (Hajir-Maire).
- ▶ Note: If  $L/K$  is unramified, then  $rd(L) = rd(K)$ . So if  $\text{Gal}(K^\emptyset/K)$  is infinite, then above  $Liminf \leq rd(K)$ .

# Why We Care About $G$

- ▶  $p$ -class towers of historical importance (the case of  $S = \emptyset$ )
- ▶ Root-discriminant bounds: e.g. among totally complex  $K$ , how small can  $rd(K) := |Disc(K)|^{1/[K:\mathbf{Q}]}$  be? Under GRH,  $Liminf \geq 44$ . Record:  $Liminf \leq 82$  (Hajir-Maire).
- ▶ Note: If  $L/K$  is unramified, then  $rd(L) = rd(K)$ . So if  $\text{Gal}(K^\emptyset/K)$  is infinite, then above  $Liminf \leq rd(K)$ .
- ▶ The tame case of the Fontaine-Mazur Conjecture: every  $p$ -adic representation  $G \rightarrow GL_n(\mathbf{Z}_p)$  has finite image.

# Why We Care About $G$

- ▶  $p$ -class towers of historical importance (the case of  $S = \emptyset$ )
- ▶ Root-discriminant bounds: e.g. among totally complex  $K$ , how small can  $rd(K) := |Disc(K)|^{1/[K:\mathbf{Q}]}$  be? Under GRH,  $Liminf \geq 44$ . Record:  $Liminf \leq 82$  (Hajir-Maire).
- ▶ Note: If  $L/K$  is unramified, then  $rd(L) = rd(K)$ . So if  $\text{Gal}(K^\emptyset/K)$  is infinite, then above  $Liminf \leq rd(K)$ .
- ▶ The tame case of the Fontaine-Mazur Conjecture: every  $p$ -adic representation  $G \rightarrow GL_n(\mathbf{Z}_p)$  has finite image.
- ▶ Interesting pro- $p$  groups arise for group theorists.

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .
- ▶ If  $H$  is a subgroup of finite index, it equals  $\text{Gal}(K^S/L)$  for some number field  $L$ .

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .
- ▶ If  $H$  is a subgroup of finite index, it equals  $\text{Gal}(K^S/L)$  for some number field  $L$ .
- ▶ By class field theory, its maximal abelian quotient  $H/H'$  is isomorphic to the  $p$ -primary part  $Cl_S(L)$  of a ray class group of  $L$  (and in particular is finite).

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .
- ▶ If  $H$  is a subgroup of finite index, it equals  $\text{Gal}(K^S/L)$  for some number field  $L$ .
- ▶ By class field theory, its maximal abelian quotient  $H/H'$  is isomorphic to the  $p$ -primary part  $Cl_S(L)$  of a ray class group of  $L$  (and in particular is finite).
- ▶ By Burnside's basis theorem, the generator rank  $d(G)$  equals  $d(G/G') = d(Cl_S(K))$ .

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .
- ▶ If  $H$  is a subgroup of finite index, it equals  $\text{Gal}(K^S/L)$  for some number field  $L$ .
- ▶ By class field theory, its maximal abelian quotient  $H/H'$  is isomorphic to the  $p$ -primary part  $Cl_S(L)$  of a ray class group of  $L$  (and in particular is finite).
- ▶ By Burnside's basis theorem, the generator rank  $d(G)$  equals  $d(G/G') = d(Cl_S(K))$ .
- ▶ Shafarevich:  $0 \leq r(G) - d(G) \leq r_1 + r_2 - 1 + \theta_S$  ( $\theta_S = 0, 1$ ).

# Ingredients

- ▶ Our goal is to find  $G$ . We know various things about  $G$ .
- ▶ If  $H$  is a subgroup of finite index, it equals  $\text{Gal}(K^S/L)$  for some number field  $L$ .
- ▶ By class field theory, its maximal abelian quotient  $H/H'$  is isomorphic to the  $p$ -primary part  $Cl_S(L)$  of a ray class group of  $L$  (and in particular is finite).
- ▶ By Burnside's basis theorem, the generator rank  $d(G)$  equals  $d(G/G') = d(Cl_S(K))$ .
- ▶ Shafarevich:  $0 \leq r(G) - d(G) \leq r_1 + r_2 - 1 + \theta_S$  ( $\theta_S = 0, 1$ ).
- ▶ In certain cases, e.g.  $K = \mathbf{Q}$ , the relations of  $G$  come from local, i.e. tame, relations. These say that the generator  $\tau_i$  of inertia at  $q_i \in S$  satisfies  $\tau_i^{\sigma_i} = \tau_i^{q_i}$  - note we do not know the Frobenius elements  $\sigma_i$  in terms of the generators  $\tau_i$  of  $G$ .

# Finite $G$

- ▶ Our strategy (NB, Leedham-Green) is to search for  $G$  by finding successively larger quotients of it, namely its  $p$ -central series quotients.

# Finite $G$

- ▶ Our strategy (NB, Leedham-Green) is to search for  $G$  by finding successively larger quotients of it, namely its  $p$ -central series quotients.
- ▶ Bad news: sometimes we find a short list of candidates for  $G$ , rather than a unique  $G$ .

# Finite $G$

- ▶ Our strategy (NB, Leedham-Green) is to search for  $G$  by finding successively larger quotients of it, namely its  $p$ -central series quotients.
- ▶ Bad news: sometimes we find a short list of candidates for  $G$ , rather than a unique  $G$ .
- ▶ Good news: these candidates are usually so similar that any question you ask of them (order, nilpotency class, ...) will have a unique answer.

# Finite $G$

- ▶ Our strategy (NB, Leedham-Green) is to search for  $G$  by finding successively larger quotients of it, namely its  $p$ -central series quotients.
- ▶ Bad news: sometimes we find a short list of candidates for  $G$ , rather than a unique  $G$ .
- ▶ Good news: these candidates are usually so similar that any question you ask of them (order, nilpotency class, ...) will have a unique answer.
- ▶ We focus on fields  $K$  such that  $rd(K)$  is small but  $Cl_{\emptyset}(K)$  is large.

# Finite $G$

- ▶ Our strategy (NB, Leedham-Green) is to search for  $G$  by finding successively larger quotients of it, namely its  $p$ -central series quotients.
- ▶ Bad news: sometimes we find a short list of candidates for  $G$ , rather than a unique  $G$ .
- ▶ Good news: these candidates are usually so similar that any question you ask of them (order, nilpotency class, ...) will have a unique answer.
- ▶ We focus on fields  $K$  such that  $rd(K)$  is small but  $Cl_\emptyset(K)$  is large.
- ▶ The method also yields theoretical results (same input  $\implies$  same output) E.g. Benjamin, Lemmermeyer, Snyder computed 2-class towers of imaginary quadratic  $K$  with  $Cl_\emptyset(K) = [2, 2, 2]$  but left gaps.

# O'Brien's Algorithm

- ▶ The lower  $p$ -central series of a  $p$ -group  $G$  is given by:  
$$P_0(G) = G, \quad P_{k+1}(G) = P_k(G)^p [G, P_k(G)]. \quad \text{So}$$
$$G = P_0(G) \geq P_1(G) \geq \dots$$

# O'Brien's Algorithm

- ▶ The lower  $p$ -central series of a  $p$ -group  $G$  is given by:  
$$P_0(G) = G, \quad P_{k+1}(G) = P_k(G)^p [G, P_k(G)]. \quad \text{So}$$
$$G = P_0(G) \geq P_1(G) \geq \dots$$
- ▶ The smallest  $c$  such that  $P_c(G) = \{1\}$  is the  $p$ -class of  $G$ .

# O'Brien's Algorithm

- ▶ The lower  $p$ -central series of a  $p$ -group  $G$  is given by:  
 $P_0(G) = G, \quad P_{k+1}(G) = P_k(G)^p [G, P_k(G)].$  So  
 $G = P_0(G) \geq P_1(G) \geq \dots$
- ▶ The smallest  $c$  such that  $P_c(G) = \{1\}$  is the  $p$ -class of  $G$ .
- ▶ We obtain a sequence of  $p$ -quotients  
 $G = G/P_c(G) \rightarrow G/P_{c-1}(G) \rightarrow \dots G/P_1(G) \cong (\mathbf{Z}/p)^{d(G)}.$

# O'Brien's Algorithm

- ▶ The lower  $p$ -central series of a  $p$ -group  $G$  is given by:  
$$P_0(G) = G, \quad P_{k+1}(G) = P_k(G)^p [G, P_k(G)]. \quad \text{So}$$
$$G = P_0(G) \geq P_1(G) \geq \dots$$
- ▶ The smallest  $c$  such that  $P_c(G) = \{1\}$  is the  $p$ -class of  $G$ .
- ▶ We obtain a sequence of  $p$ -quotients  
$$G = G/P_c(G) \rightarrow G/P_{c-1}(G) \rightarrow \dots G/P_1(G) \cong (\mathbf{Z}/p)^{d(G)}.$$
- ▶ If  $H \cong G/P_{k+1}(G)$  and  $K \cong G/P_k(G)$ , we say that  $H$  is an immediate descendant of  $K$ .

# O'Brien's Algorithm

- ▶ The lower  $p$ -central series of a  $p$ -group  $G$  is given by:  
$$P_0(G) = G, \quad P_{k+1}(G) = P_k(G)^p [G, P_k(G)]. \quad \text{So}$$
$$G = P_0(G) \geq P_1(G) \geq \dots$$
- ▶ The smallest  $c$  such that  $P_c(G) = \{1\}$  is the  $p$ -class of  $G$ .
- ▶ We obtain a sequence of  $p$ -quotients  
$$G = G/P_c(G) \rightarrow G/P_{c-1}(G) \rightarrow \dots G/P_1(G) \cong (\mathbf{Z}/p)^{d(G)}.$$
- ▶ If  $H \cong G/P_{k+1}(G)$  and  $K \cong G/P_k(G)$ , we say that  $H$  is an immediate descendant of  $K$ .
- ▶ O'Brien's algorithm finds all immediate descendants of a given  $p$ -group  $K$  (up to isomorphism).

# Method with Leedham-Green

- ▶ To find our Galois group  $G$ , we successively find  $G/P_k(G)$  ( $k = 1, 2, \dots$ ).

# Method with Leedham-Green

- ▶ To find our Galois group  $G$ , we successively find  $G/P_k(G)$  ( $k = 1, 2, \dots$ ).
- ▶ Note that  $G/P_1(G) = (\mathbf{Z}/p)^{d(G)}$  and  $d(G) = d(Cl_S(K))$ .

# Method with Leedham-Green

- ▶ To find our Galois group  $G$ , we successively find  $G/P_k(G)$  ( $k = 1, 2, \dots$ ).
- ▶ Note that  $G/P_1(G) = (\mathbf{Z}/p)^{d(G)}$  and  $d(G) = d(Cl_S(K))$ .
- ▶ Given  $G/P_{k-1}(G)$ , O'Brien's algorithm yields all possible  $G/P_k(G)$ .

# Method with Leedham-Green

- ▶ To find our Galois group  $G$ , we successively find  $G/P_k(G)$  ( $k = 1, 2, \dots$ ).
- ▶ Note that  $G/P_1(G) = (\mathbf{Z}/p)^{d(G)}$  and  $d(G) = d(Cl_S(K))$ .
- ▶ Given  $G/P_{k-1}(G)$ , O'Brien's algorithm yields all possible  $G/P_k(G)$ .
- ▶ We only save those  $G/P_k(G)$  that are number theoretically feasible- namely that do not violate information we have about abelianizations of low index subgroups of  $G$  or about the generator and relation ranks of  $G$ .

# Generating Lattice Data

- ▶ For simplicity of exposition, take the case  $p = 2$  and  $S = \emptyset$ . For the general case the same ideas apply with class groups replaced by certain ray class groups. We want  $G = \text{Gal}(K^\emptyset/K)$ .

# Generating Lattice Data

- ▶ For simplicity of exposition, take the case  $p = 2$  and  $S = \emptyset$ . For the general case the same ideas apply with class groups replaced by certain ray class groups. We want  $G = \text{Gal}(K^\emptyset/K)$ .
- ▶ First calculate the 2-class group  $Cl_\emptyset(K)$ . This tells us  $G/G'$  and so  $G/P_1(G)$  and  $d(G)$ .

# Generating Lattice Data

- ▶ For simplicity of exposition, take the case  $p = 2$  and  $S = \emptyset$ . For the general case the same ideas apply with class groups replaced by certain ray class groups. We want  $G = \text{Gal}(K^\emptyset/K)$ .
- ▶ First calculate the 2-class group  $Cl_\emptyset(K)$ . This tells us  $G/G'$  and so  $G/P_1(G)$  and  $d(G)$ .
- ▶ Explicit class field theory yields all unramified quadratic extensions of  $K$ . For each such  $L$  we compute  $Cl_\emptyset(L)$ .

# Generating Lattice Data

- ▶ For simplicity of exposition, take the case  $p = 2$  and  $S = \emptyset$ . For the general case the same ideas apply with class groups replaced by certain ray class groups. We want  $G = \text{Gal}(K^\emptyset/K)$ .
- ▶ First calculate the 2-class group  $Cl_\emptyset(K)$ . This tells us  $G/G'$  and so  $G/P_1(G)$  and  $d(G)$ .
- ▶ Explicit class field theory yields all unramified quadratic extensions of  $K$ . For each such  $L$  we compute  $Cl_\emptyset(L)$ .
- ▶ Stop there, or find all unramified quadratic extensions of all such  $L$  and their 2-class groups. Check for duplicates.

# Generating Lattice Data

- ▶ For simplicity of exposition, take the case  $p = 2$  and  $S = \emptyset$ . For the general case the same ideas apply with class groups replaced by certain ray class groups. We want  $G = \text{Gal}(K^\emptyset/K)$ .

- ▶ Explicit class field theory yields all unramified quadratic extensions of  $K$ . For each such  $L$  we compute  $Cl_\emptyset(L)$ .
- ▶ Stop there, or find all unramified quadratic extensions of all such  $L$  and their 2-class groups. Check for duplicates.
- ▶ Now you have the abelianizations of all index  $\leq 4$  subgroups of  $G$ .

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.
- ▶ For each such  $P$ , compute its subgroups of index  $\leq 4$  and their abelianizations.

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.
- ▶ For each such  $P$ , compute its subgroups of index  $\leq 4$  and their abelianizations.
- ▶ Compare with the abelianizations of subgroups of index  $\leq 4$  of  $G$ .

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.
- ▶ For each such  $P$ , compute its subgroups of index  $\leq 4$  and their abelianizations.
- ▶ Compare with the abelianizations of subgroups of index  $\leq 4$  of  $G$ .
- ▶ The abelianizations for  $P$  have to be no bigger than those for  $G$ .

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.
- ▶ For each such  $P$ , compute its subgroups of index  $\leq 4$  and their abelianizations.
- ▶ Compare with the abelianizations of subgroups of index  $\leq 4$  of  $G$ .
- ▶ The abelianizations for  $P$  have to be no bigger than those for  $G$ .
- ▶ For  $k$  large enough, the abelianizations for  $P$  must equal those for  $G$ .

# Pruning the Tree (Abelianizations)

- ▶ Given  $G/P_{k-1}(G)$ , find all its immediate descendants.
- ▶ For each such  $P$ , compute its subgroups of index  $\leq 4$  and their abelianizations.
- ▶ Compare with the abelianizations of subgroups of index  $\leq 4$  of  $G$ .
- ▶ The abelianizations for  $P$  have to be no bigger than those for  $G$ .
- ▶ For  $k$  large enough, the abelianizations for  $P$  must equal those for  $G$ .
- ▶ Delete any  $P$  that fail either of these two constraints.

# Pruning the Tree (Cohomology)

- ▶ Lemma: If  $G_k = G/P_k(G)$ , then the difference between the  $p$ -multiplier rank and nuclear rank of  $G$  is at most  $r(G)$ .

# Pruning the Tree (Cohomology)

- ▶ Lemma: If  $G_k = G/P_k(G)$ , then the difference between the  $p$ -multiplier rank and nuclear rank of  $G$  is at most  $r(G)$ .
- ▶ Moreover, we have earlier bounds for  $r(G)$  - for instance if  $K$  is totally complex,  $0 \leq r(G) - d(G) \leq [K : \mathbf{Q}]/2$ . Knowing  $d(G)$  this bounds  $r(G)$ .

# Pruning the Tree (Cohomology)

- ▶ Lemma: If  $G_k = G/P_k(G)$ , then the difference between the  $p$ -multiplier rank and nuclear rank of  $G$  is at most  $r(G)$ .
- ▶ Moreover, we have earlier bounds for  $r(G)$  - for instance if  $K$  is totally complex,  $0 \leq r(G) - d(G) \leq [K : \mathbf{Q}]/2$ . Knowing  $d(G)$  this bounds  $r(G)$ .
- ▶ For the immediate descendant under consideration,  $P$ , delete it if the difference between its  $p$ -multiplier rank and nuclear rank is too large.

# Pruning the Tree (Cohomology)

- ▶ Lemma: If  $G_k = G/P_k(G)$ , then the difference between the  $p$ -multiplier rank and nuclear rank of  $G$  is at most  $r(G)$ .
- ▶ Moreover, we have earlier bounds for  $r(G)$  - for instance if  $K$  is totally complex,  $0 \leq r(G) - d(G) \leq [K : \mathbf{Q}]/2$ . Knowing  $d(G)$  this bounds  $r(G)$ .
- ▶ For the immediate descendant under consideration,  $P$ , delete it if the difference between its  $p$ -multiplier rank and nuclear rank is too large.
- ▶ You can also keep track of inertial generators and complex conjugation (no help if  $S = \emptyset$  and  $K$  is totally complex!).

# Narrowing Candidates

- ▶ If this process terminates, then we know  $G$  is on the list of candidates (so  $G$  is finite).

# Narrowing Candidates

- ▶ If this process terminates, then we know  $G$  is on the list of candidates (so  $G$  is finite).
- ▶ This (often long) list can be shortened by finding an index 4 subgroup whose index 8 subgroups differ among the different candidates.

# Narrowing Candidates

- ▶ If this process terminates, then we know  $G$  is on the list of candidates (so  $G$  is finite).
- ▶ This (often long) list can be shortened by finding an index 4 subgroup whose index 8 subgroups differ among the different candidates.
- ▶ Find the field corresponding to this index 4 subgroup.

# Narrowing Candidates

- ▶ If this process terminates, then we know  $G$  is on the list of candidates (so  $G$  is finite).
- ▶ This (often long) list can be shortened by finding an index 4 subgroup whose index 8 subgroups differ among the different candidates.
- ▶ Find the field corresponding to this index 4 subgroup.
- ▶ Find its unramified quadratic extensions and their 2-class groups.

# Narrowing Candidates

- ▶ If this process terminates, then we know  $G$  is on the list of candidates (so  $G$  is finite).
- ▶ This (often long) list can be shortened by finding an index 4 subgroup whose index 8 subgroups differ among the different candidates.
- ▶ Find the field corresponding to this index 4 subgroup.
- ▶ Find its unramified quadratic extensions and their 2-class groups.
- ▶ See which of the candidates have matching abelianizations.

# Example

- ▶ Let  $K = \mathbf{Q}(\sqrt{-3135})$ .

# Example

- ▶ Let  $K = \mathbf{Q}(\sqrt{-3135})$ .
- ▶  $rd(K) = 56$  so if  $K$  has an infinite 2-class tower, then the liminf bound drops from 82 to 56.

# Example

- ▶ Let  $K = \mathbf{Q}(\sqrt{-3135})$ .
- ▶  $rd(K) = 56$  so if  $K$  has an infinite 2-class tower, then the liminf bound drops from 82 to 56.
- ▶ Its 2-class group is  $[2, 2, 2]$ , one of the cases Benjamin-Lemmermeyer-Snyder left open.

# Example

- ▶ Let  $K = \mathbf{Q}(\sqrt{-3135})$ .
- ▶  $rd(K) = 56$  so if  $K$  has an infinite 2-class tower, then the liminf bound drops from 82 to 56.
- ▶ Its 2-class group is  $[2, 2, 2]$ , one of the cases Benjamin-Lemmermeyer-Snyder left open.
- ▶ Lattice data -  $K$  has 7 unramified quadratic extensions; the 2-class groups are  $[2, 2, 2]$  (three times),  $[2, 8]$  (twice),  $[2, 2, 2, 2]$  (once),  $[2, 16]$  (once).

# Example

- ▶ Let  $K = \mathbf{Q}(\sqrt{-3135})$ .
- ▶  $rd(K) = 56$  so if  $K$  has an infinite 2-class tower, then the liminf bound drops from 82 to 56.
- ▶ Its 2-class group is  $[2, 2, 2]$ , one of the cases Benjamin-Lemmermeyer-Snyder left open.
- ▶ Lattice data -  $K$  has 7 unramified quadratic extensions; the 2-class groups are  $[2, 2, 2]$  (three times),  $[2, 8]$  (twice),  $[2, 2, 2, 2]$  (once),  $[2, 16]$  (once).
- ▶ At the next level we get 31 fields, degree 4 over  $K$ , and their 2-class groups.

## Example (Continued)

- ▶  $G/P_1(G) \cong (\mathbf{Z}/2)^3$ , which by O'Brien has 67 immediate descendants.

## Example (Continued)

- ▶  $G/P_1(G) \cong (\mathbf{Z}/2)^3$ , which by O'Brien has 67 immediate descendants.
- ▶ Of these, 4 fail the cohomological condition.

## Example (Continued)

- ▶  $G/P_1(G) \cong (\mathbf{Z}/2)^3$ , which by O'Brien has 67 immediate descendants.
- ▶ Of these, 4 fail the cohomological condition.
- ▶ A further 44 have too large an abelianization.

## Example (Continued)

- ▶  $G/P_1(G) \cong (\mathbf{Z}/2)^3$ , which by O'Brien has 67 immediate descendants.
- ▶ Of these, 4 fail the cohomological condition.
- ▶ A further 44 have too large an abelianization.
- ▶ Another 18 have an index 2 subgroup with too large abelianization.

## Example (Continued)

- ▶  $G/P_1(G) \cong (\mathbf{Z}/2)^3$ , which by O'Brien has 67 immediate descendants.
- ▶ Of these, 4 fail the cohomological condition.
- ▶ A further 44 have too large an abelianization.
- ▶ Another 18 have an index 2 subgroup with too large abelianization.
- ▶ Leaves 1 immediate descendant, which must be  $G/P_2(G)$ !

## Example (Continued)

- ▶ This group has 186 immediate descendants.

## Example (Continued)

- ▶ This group has 186 immediate descendants.
- ▶ All but 16 (all order 256) fail cohomological or abelianization criterion.

## Example (Continued)

- ▶ This group has 186 immediate descendants.
- ▶ All but 16 (all order 256) fail cohomological or abelianization criterion.
- ▶ The search grows, but ultimately we're left with 240 candidates for  $G$ .

## Example (Continued)

- ▶ This group has 186 immediate descendants.
- ▶ All but 16 (all order 256) fail cohomological or abelianization criterion.
- ▶ The search grows, but ultimately we're left with 240 candidates for  $G$ .
- ▶ We apply the cohomological criterion to low index subgroups of each candidate, leaving 84 survivors.

## Example (Continued)

- ▶ This group has 186 immediate descendants.
- ▶ All but 16 (all order 256) fail cohomological or abelianization criterion.
- ▶ The search grows, but ultimately we're left with 240 candidates for  $G$ .
- ▶ We apply the cohomological criterion to low index subgroups of each candidate, leaving 84 survivors.
- ▶ Computing extensions of particular degree 4 extensions of  $K$  eventually cut us down to 4 candidates, all order 8192 and of derived length 3.

# Upshot in Finite Case

- ▶ The search for fields of low discriminant but infinite 2-class tower has a long history.

# Upshot in Finite Case

- ▶ The search for fields of low discriminant but infinite 2-class tower has a long history.
- ▶ Several years ago, Stark asked if  $\mathbf{Q}(\sqrt{-2379})$  (2-class group  $[4, 4]$ ) has infinite 2-class tower, i.e. infinite  $G$ . Bush showed it finite and obtained the first examples with derived length 3.

# Upshot in Finite Case

- ▶ Idea: pick random words  $c, d$  and look at  $\langle x, y \mid x^c = x^5, y^d = y^5 \rangle$ .
- ▶ If the abelianizations of its low index subgroups are all finite and the sizes of its  $p$ -quotients do not stabilize (within range of computer), then save  $c, d$ .

# An Experiment (Continued)

- ▶ We thus obtain some plausible  $c, d$  and so plausible  $G$ .

# An Experiment (Continued)

- ▶ We thus obtain some plausible  $c, d$  and so plausible  $G$ .
- ▶ Amazing observation - the  $G$  that survive belong to one special family.

# An Experiment (Continued)

- ▶ We thus obtain some plausible  $c, d$  and so plausible  $G$ .
- ▶ Amazing observation - the  $G$  that survive belong to one special family.
- ▶ Conjecture: (1)  $G$  has presentation of the form  $\langle x, y \mid x^a = x^5, y^4 = 1 \rangle$  (2) Moreover, the orders of  $G/P_k(G)$  ( $k = 1, 2, \dots$ ) are  $2^2, 2^5, 2^8, 2^{11}, 2^{14}, 2^{16}, 2^{20}, 2^{24}, 2^{30}, 2^{36}, 2^{44}, 2^{52}, 2^{64}, 2^{76}, 2^{93}, \dots$

# Strategy in Infinite Case

- ▶ A Golod-Shafarevich (G-S) group is one satisfying  $r(G) \leq d(G)^2/4$ .

# Strategy in Infinite Case

- ▶ A Golod-Shafarevich (G-S) group is one satisfying  $r(G) \leq d(G)^2/4$ .
- ▶ To show that  $G$  is infinite, it's enough to find a G-S subgroup of finite index.

# Strategy in Infinite Case

- ▶ A Golod-Shafarevich (G-S) group is one satisfying  $r(G) \leq d(G)^2/4$ .
- ▶ To show that  $G$  is infinite, it's enough to find a G-S subgroup of finite index.
- ▶ The Virtual Golod-Shafarevich (VGS) Conjecture says that infinite  $G$  always have a G-S subgroup of finite index.

# Strategy in Infinite Case

- ▶ A Golod-Shafarevich (G-S) group is one satisfying  $r(G) \leq d(G)^2/4$ .
- ▶ To show that  $G$  is infinite, it's enough to find a G-S subgroup of finite index.
- ▶ The Virtual Golod-Shafarevich (VGS) Conjecture says that infinite  $G$  always have a G-S subgroup of finite index.
- ▶ Strategy to prove  $G$  infinite - find family of groups that  $G$  belongs to; find their G-S subgroup; locate the corresponding field; apply Golod-Shafarevich to it.

# Tame Fontaine-Mazur Conjecture

- ▶ Recall this says that no  $G$  has an infinite quotient that's a subgroup of some  $GL_n(\mathbf{Z}_p)$ .

# Tame Fontaine-Mazur Conjecture

- ▶ Recall this says that no  $G$  has an infinite quotient that's a subgroup of some  $GL_n(\mathbf{Z}_p)$ .
- ▶ The VGS conjecture implies more generally that every infinite  $G$  has a large action on a locally finite, rooted tree.

# Arboreal Galois Representations

- ▶ If  $T$  is a locally finite, rooted tree, then a continuous homomorphism  $\text{Gal}(\overline{K}/K) \rightarrow \text{Aut}(T)$  is called an arboreal Galois representation.

# Arboreal Galois Representations

- ▶ If  $T$  is a locally finite, rooted tree, then a continuous homomorphism  $\text{Gal}(\overline{K}/K) \rightarrow \text{Aut}(T)$  is called an arboreal Galois representation.
- ▶ One source of these comes from the extension of the tame Fontaine-Mazur conjecture.

# Arboreal Galois Representations

- ▶ If  $T$  is a locally finite, rooted tree, then a continuous homomorphism  $\text{Gal}(\overline{K}/K) \rightarrow \text{Aut}(T)$  is called an arboreal Galois representation.
- ▶ One source of these comes from the extension of the tame Fontaine-Mazur conjecture.
- ▶ Another source comes from Galois action on roots of iterates of a polynomial.

# Arboreal Galois Representations

- ▶ If  $T$  is a locally finite, rooted tree, then a continuous homomorphism  $\text{Gal}(\overline{K}/K) \rightarrow \text{Aut}(T)$  is called an arboreal Galois representation.
- ▶ One source of these comes from the extension of the tame Fontaine-Mazur conjecture.
- ▶ Another source comes from Galois action on roots of iterates of a polynomial.
- ▶ In analogy to  $p$ -adic Galois representations, we look to characterize their images and the images of their Frobenius elements.

# Example (with Rafe Jones)

- ▶ Let  $f = (x + 1)^2 - 2 \in \mathbf{Q}[x]$ .

# Example (with Rafe Jones)

- ▶ Let  $f = (x + 1)^2 - 2 \in \mathbf{Q}[x]$ .
- ▶ The  $n$ th iterate of  $f$  has discriminant a 2-power, so the Galois action on its roots is ramified only at 2 and  $\infty$ . (These roots form the  $n$ th level of a tree  $T$ .)

# Example (with Rafe Jones)

- ▶ Let  $f = (x + 1)^2 - 2 \in \mathbf{Q}[x]$ .
- ▶ The  $n$ th iterate of  $f$  has discriminant a 2-power, so the Galois action on its roots is ramified only at 2 and  $\infty$ . (These roots form the  $n$ th level of a tree  $T$ .)
- ▶ Big Question: Is the union of the splitting fields of all these iterates the maximal 2-extension of  $\mathbf{Q}$  unramified outside 2 and  $\infty$ ?

# Example (with Rafe Jones)

- ▶ Let  $f = (x + 1)^2 - 2 \in \mathbf{Q}[x]$ .
- ▶ The  $n$ th iterate of  $f$  has discriminant a 2-power, so the Galois action on its roots is ramified only at 2 and  $\infty$ . (These roots form the  $n$ th level of a tree  $T$ .)
- ▶ Big Question: Is the union of the splitting fields of all these iterates the maximal 2-extension of  $\mathbf{Q}$  unramified outside 2 and  $\infty$ ?
- ▶ Thanks to Klüners and Fieker, we find the Galois groups of the  $n$ th iterates ( $n = 1, 2, \dots, 7$ ), which have orders  $2^1, 2^3, 2^6, 2^{11}, 2^{22}, 2^{43}, 2^{86}$ .

# Conjecture

- ▶ The Basilica group  $B = \langle a, b \rangle$  is a known subgroup of  $\text{Aut}(T)$  with similar growth.

# Conjecture

- ▶ The Basilica group  $B = \langle a, b \rangle$  is a known subgroup of  $\text{Aut}(T)$  with similar growth.
- ▶ Conjecture: The Galois group of the  $n$ th iterate over  $\mathbf{Q}(i)$  is the subgroup  $\langle [a, b], aba \rangle$  acting on the  $2^n$  vertices of  $T$  at level  $n$ .

# Conjecture

- ▶ The Basilica group  $B = \langle a, b \rangle$  is a known subgroup of  $\text{Aut}(T)$  with similar growth.
- ▶ Conjecture: The Galois group of the  $n$ th iterate over  $\mathbf{Q}(i)$  is the subgroup  $\langle [a, b], aba \rangle$  acting on the  $2^n$  vertices of  $T$  at level  $n$ .
- ▶ The closure of  $\langle [a, b], aba \rangle$  is not free.

# Conjecture

- ▶ The Basilica group  $B = \langle a, b \rangle$  is a known subgroup of  $\text{Aut}(T)$  with similar growth.
- ▶ Conjecture: The Galois group of the  $n$ th iterate over  $\mathbf{Q}(i)$  is the subgroup  $\langle [a, b], aba \rangle$  acting on the  $2^n$  vertices of  $T$  at level  $n$ .
- ▶ The closure of  $\langle [a, b], aba \rangle$  is not free.
- ▶ The Galois group over  $\mathbf{Q}(i)$  of the maximal 2-extension unramified outside 2 and  $\infty$  is free (Markscheitis, 1963).

# Conjecture

- ▶ The Basilica group  $B = \langle a, b \rangle$  is a known subgroup of  $\text{Aut}(T)$  with similar growth.
- ▶ Conjecture: The Galois group of the  $n$ th iterate over  $\mathbf{Q}(i)$  is the subgroup  $\langle [a, b], aba \rangle$  acting on the  $2^n$  vertices of  $T$  at level  $n$ .
- ▶ The closure of  $\langle [a, b], aba \rangle$  is not free.
- ▶ The Galois group over  $\mathbf{Q}(i)$  of the maximal 2-extension unramified outside 2 and  $\infty$  is free (Markscheitis, 1963).
- ▶ Consequence: Answer to the big question is no. (In fact, we just need that  $\overline{B}$  contains no nonabelian free pro-2 subgroup.)
