# Numerical computation of endomorphism rings of Jacobians

Nils Bruin (Simon Fraser University), Jeroen Sijsling (Ulm), Alexandre Zotine (Simon Fraser University)

July 16, 2018, Madison

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

## Setting

- $k \subset \mathbb{C}$  a number field
- C a proper smooth absolutely irreducible curve over k of genus g, represented by an affine plane model:

$$\tilde{C}$$
:  $f(x,y) = 0$  where  $f(x,y) \in k[x,y]$ .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

## Setting

- $k \subset \mathbb{C}$  a number field
- C a proper smooth absolutely irreducible curve over k of genus g, represented by an affine plane model:

$$\tilde{C}$$
:  $f(x,y) = 0$  where  $f(x,y) \in k[x,y]$ .

(ロ) (同) (三) (三) (三) (○) (○)

#### Analytic Jacobian:

$$J(\mathbb{C}) \cong \mathrm{H}^{0}(C_{\mathbb{C}}, \Omega^{1}_{C})^{*} / \mathrm{H}_{1}(C(\mathbb{C}), \mathbb{Z}) \cong \mathbb{C}^{g} / \Omega \mathbb{Z}^{2g},$$

## Setting

- $k \subset \mathbb{C}$  a number field
- C a proper smooth absolutely irreducible curve over k of genus g, represented by an affine plane model:

$$\tilde{C}$$
:  $f(x,y) = 0$  where  $f(x,y) \in k[x,y]$ .

#### Analytic Jacobian:

$$J(\mathbb{C}) \cong \mathrm{H}^{0}(C_{\mathbb{C}}, \Omega^{1}_{C})^{*}/\mathrm{H}_{1}(C(\mathbb{C}), \mathbb{Z}) \cong \mathbb{C}^{g}/\Omega\mathbb{Z}^{2g},$$

- Basis for  $\mathrm{H}^{0}(C_{\mathbb{C}}, \Omega^{1}_{C})$ :  $\omega_{1}, \ldots, \omega_{g}$
- ► Basis for  $H_1(C(\mathbb{C}),\mathbb{Z})$ :  $\alpha_1,\ldots,\alpha_g,\beta_1,\ldots,\beta_g$
- Period matrix:  $\Omega = \left( \int_{\alpha_j} \omega_i \right| \int_{\beta_j} \omega_i \right)_{i,j}$

**Goal:** Numerically compute  $\Omega$  and read off properties of *C*.

**Design criterion:** Applications need lots of digits. Machine precision (53 bits) is not enough. **Other work:** 

Deconinck-van Hoeij (2001): General case (Maple) van Wamelen (2006): Hyperelliptic curves (Magma) Molin-Neurohr (2017): Superelliptic curves (C/Arb) Neurohr (2018): General implementation (in Magma?)

(ロ) (同) (三) (三) (三) (○) (○)

**Design criterion:** Applications need lots of digits. Machine precision (53 bits) is not enough. **Other work:** 

Deconinck-van Hoeij (2001): General case (Maple) van Wamelen (2006): Hyperelliptic curves (Magma) Molin-Neurohr (2017): Superelliptic curves (C/Arb) Neurohr (2018): General implementation (in Magma?) Our contributions:

- Use certified homotopy continuation
- Simple way of getting homology generators
- Flexible implementation that is easy to improve and adapt (in Sage)
- Compute automorphisms of C via Torelli theorem

# Basis for $\mathrm{H}^{0}(C_{\mathbb{C}}, \Omega^{1}_{C})$

 $\mathrm{H}^{0}(C_{\mathbb{C}}, \Omega^{1}_{C}) = \mathrm{H}^{0}(C, \Omega^{1}_{C}) \otimes \mathbb{C}$  contains the *regular differentials* on *C* (i.e., the ones that have no poles)

• If  $\tilde{C}$ : f(x,y) = 0 with deg(f) = n then

$$\mathrm{H}^{0}(C,\Omega_{C}^{1}) \subset \left\{ \frac{h\,dx}{\partial_{y}f(x,y)} : \mathrm{deg}(h) \leq n-3 \right\}.$$

- Singularities impose linear conditions on h.
- ► If singularities are in {(1:0:0), (0:1:0), (0:0:1)}, conditions are easy to write down
- Otherwise, adjoint ideal gives required information
- > Algebraic process, implemented in Singular.

**Result:** Basis  $\omega_1, \ldots, \omega_g$ , where

$$\omega_i = \frac{h_i(x,y) dx}{\partial_y f(x,y)}$$
 with  $h_i \in k[x,y]$ 

## Basis for $H_1(C(\mathbb{C}),\mathbb{Z})$

► H<sub>1</sub>(C(ℂ),ℤ) consists of *cycles* modulo equivalence

# Basis for $\mathrm{H}_1(C(\mathbb{C}),\mathbb{Z})$

- ► H<sub>1</sub>(C(C),Z) consists of *cycles* modulo equivalence
- ► C(C) is a compact Riemann surface, so H<sub>1</sub>(C(C), Z) ≃ Z<sup>2g</sup>

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

 Generated by classes of generators of the fundamental group

# Basis for $H_1(C(\mathbb{C}),\mathbb{Z})$

- ► H<sub>1</sub>(C(C),Z) consists of *cycles* modulo equivalence
- ► C(C) is a compact Riemann surface, so H<sub>1</sub>(C(C), Z) ≃ Z<sup>2g</sup>
- Generated by classes of generators of the fundamental group
- ► C(C) is an oriented topological surface, so H<sub>1</sub>(C(C),Z) comes with a non-degenerate alternating intersection pairing.

(日) (日) (日) (日) (日) (日) (日)

# Basis for $H_1(C(\mathbb{C}),\mathbb{Z})$

- ► H<sub>1</sub>(C(C),Z) consists of *cycles* modulo equivalence
- ► C(C) is a compact Riemann surface, so H<sub>1</sub>(C(C), Z) ≃ Z<sup>2g</sup>
- Generated by classes of generators of the fundamental group
- ► C(C) is an oriented topological surface, so H<sub>1</sub>(C(C),Z) comes with a non-degenerate alternating intersection pairing.

#### Strategy:

- Determine loops on  $C(\mathbb{C})$  that generate fundamental group
- Compute their intersection pairing matrix
- Use  $\mathbb{Z}$ -linear algebra to get a basis for  $H_1(C(\mathbb{C}),\mathbb{Z})$ .

**One solution:** Tretkoff-Tretkoff (1984) – rather opaque algorithm.

# Lifting homotopy

Consider finite cover  $\tilde{C} \to \mathbb{C}$ ;  $(x, y) \mapsto x$  of degree  $n = \deg_y(f)$ . Unramified outside

$$S = \{x \in \mathbb{C} : \operatorname{disc}_y f(x, y) = 0\}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Consider finite cover  $\tilde{C} \to \mathbb{C}$ ;  $(x, y) \mapsto x$  of degree  $n = \deg_y(f)$ . Unramified outside

$$S = \{x \in \mathbb{C} : \operatorname{disc}_y f(x, y) = 0\}$$

► Determine a connected plane graph (V,E) in C - S for which a cycle basis generates the fundamental group of C - S

Consider finite cover  $\tilde{C} \to \mathbb{C}$ ;  $(x, y) \mapsto x$  of degree  $n = \deg_y(f)$ . Unramified outside

$$S = \{x \in \mathbb{C} : \operatorname{disc}_y f(x, y) = 0\}$$

► Determine a connected plane graph (V,E) in C - S for which a cycle basis generates the fundamental group of C - S

• Lift graph to  $(\tilde{V}, \tilde{E})$  on  $\tilde{C} - x^{-1}(S)$ .

Consider finite cover  $\tilde{C} \to \mathbb{C}$ ;  $(x, y) \mapsto x$  of degree  $n = \deg_y(f)$ . Unramified outside

$$S = \{x \in \mathbb{C} : \operatorname{disc}_y f(x, y) = 0\}$$

- ► Determine a connected plane graph (V,E) in C S for which a cycle basis generates the fundamental group of C - S
- Lift graph to  $(\tilde{V}, \tilde{E})$  on  $\tilde{C} x^{-1}(S)$ .
- A cycle basis of (*Ṽ*, *Ẽ*) generates the fundamental group of *C̃*−x<sup>-1</sup>(S) and hence of C.

(日) (日) (日) (日) (日) (日) (日)

## **Using Voronoi decomposition**

**Example:** 
$$\tilde{C}: y^2 = x^3 - x - 1$$

$$S = \{s_1, s_2, s_3\}$$

Take (bounded) Voronoi cells:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

# Lifting edges

#### Lifting vertices and edges

- Lift v to C to  $v^{(i)} = (x_v, y_v^{(i)})$  by solving  $f(x_v, y_v^{(i)}) = 0$ .
- ► Given edge e = (v, w), parametrize  $x(t) = (1 t)x_v + tx_w$ .

- ► Let  $y^{(i)}(t)$  be the continuous function determined by  $y^{(i)}(0) = y^{(i)}_{\nu}$  and  $f(x(t), y^{(i)}(t)) = 0$
- ▶ Then  $e^{(i)} = \{(x(t), y^{(i)}(t) : t \in [0, 1]\}$  is a lift of *e* to  $\tilde{C}$ .

#### Lifting vertices and edges

- Lift v to C to  $v^{(i)} = (x_v, y_v^{(i)})$  by solving  $f(x_v, y_v^{(i)}) = 0$ .
- ► Given edge e = (v, w), parametrize  $x(t) = (1 t)x_v + tx_w$ .
- Let y<sup>(i)</sup>(t) be the continuous function determined by y<sup>(i)</sup>(0) = y<sup>(i)</sup><sub>v</sub> and f(x(t), y<sup>(i)</sup>(t)) = 0
- ▶ Then  $e^{(i)} = \{(x(t), y^{(i)}(t) : t \in [0, 1]\}$  is a lift of *e* to  $\tilde{C}$ .

#### **Certified continuation:**

• For 
$$t_0$$
, set  $\varepsilon = \frac{1}{3} \min_{i \neq j} |y^{(i)}(t_0) - y^{(j)}(t_0)|$ 

- ► (Kranich 2015): Compute explicit  $\delta > 0$  such that for  $t_0 \le t_1 < t_0 + \delta$  we have  $|y^{(i)}(t_1) y^{(i)}(t_0)| < \varepsilon$
- ► Store sequence of points along e<sup>(i)</sup> from which (x(t), y(t)) can be reliably interpolated.

## Intersection pairing

- Cycle basis γ<sub>1</sub>,..., γ<sub>r</sub> for (Ṽ, Ẽ) gives us generators for H<sub>1</sub>(C(ℂ),ℤ).
- Orientation gives us a signed intersection pairing:

► There is a basis α<sub>1</sub>,..., α<sub>g</sub>, β<sub>1</sub>,..., β<sub>g</sub> such that the Gram matrix for the pairing is

$$\begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix}$$

An algorithm of Frobenius allows us to find such a basis.

Cycles α<sub>i</sub>, β<sub>i</sub> represented as Z-linear combinations of edges e<sup>(k)</sup><sub>νw</sub>:

$$\int_{e_{vw}^{(k)}} \omega_i = |w - v| \int_{t=0}^1 \frac{h_i(x(t), y(t))}{\partial_y f(x(t), y(t))} dt$$

- Integral is well-suited for computation using a high-order method, such as Gauss-Legendre.
- Presently heuristic adaptive integration method
- Future: Johansen's ARB/ACB library now provides numerical integration with guaranteed error bounds and has a good interface in Sage.

Suppose  $C_1, C_2$  are curves with Jacobians  $J_1, J_2$ , with bases for differentials and homology

- Consider a homomorphism  $\phi: J_1 \rightarrow J_2$ .
- ►  $T = T_{\phi}$ :  $\mathrm{H}^{0}(C_{1}, \Omega^{1}_{C_{1}})^{*} \to \mathrm{H}^{0}(C_{2}, \Omega^{1}_{C_{2}})^{*}$   $T_{\phi} \in M_{g_{2}, g_{1}}(\mathbb{C})$

$$\blacktriangleright R = R_{\phi} \colon \mathrm{H}_{1}(C_{1},\mathbb{Z}) \to \mathrm{H}_{1}(C_{2},\mathbb{Z})$$

 $\begin{aligned} I_{\phi} &\in M_{g_2,g_1}(\mathbb{C}) \\ R_{\phi} &\in M_{2g_2,2g_1}(\mathbb{Z}) \end{aligned}$ 

(日) (日) (日) (日) (日) (日) (日)

Suppose  $C_1, C_2$  are curves with Jacobians  $J_1, J_2$ , with bases for differentials and homology

- Consider a homomorphism  $\phi: J_1 \rightarrow J_2$ .
- ►  $T = T_{\phi}$ :  $\mathrm{H}^{0}(C_{1}, \Omega_{C_{1}}^{1})^{*} \to \mathrm{H}^{0}(C_{2}, \Omega_{C_{2}}^{1})^{*}$   $T_{\phi} \in M_{g_{2},g_{1}}(\mathbb{C})$ ►  $R = R_{\phi}$ :  $\mathrm{H}_{1}(C_{1}, \mathbb{Z}) \to \mathrm{H}_{1}(C_{2}, \mathbb{Z})$   $R_{\phi} \in M_{2g_{2},2g_{1}}(\mathbb{Z})$

**Lemma:** If  $\Omega_i = (I_{g_i} | \tau_i)$  then

$$R=egin{pmatrix} D & B\ C & A \end{pmatrix}$$
 , where  $D,B,C,A\in M_{g_2,g_1}(\mathbb{Z}).$ 

and  $T = D + \tau_2 C$ , with  $B + \tau_2 A = (D + \tau_2 C) \tau_1$ .

**Result:**  $2g_1g_2$  equations with real coefficients in  $4g_1g_2$  integer variables, so LLL can find small integer solutions.

Suppose we have a  $\mathbb{Z}$ -basis  $B_1, \ldots, B_r$  for  $\operatorname{End}(J) = \operatorname{Hom}(J, J)$ .

- ► We can determine idempotents in End(*J*), which give isogeny factors.
- We can determine units.
- ▶ If symplectic structure is taken into account, we get a *finite* group of symplectic automorphisms. The Torelli theorem relates this to Aut(*C*).

Via action on tangent space, we get action of automorphisms on canonical model of *C*. We can verify automorphisms algebraically this way.

Similarly, numerically found endomorphisms can be certified: [Costa-Mascot-Sijsling-Voight, 2016] (from Sutherland):

$$C_1: -x^2y^2 - xy^3 + x^3 + 2x^2y + 2xy^2 - x^2 - y = 0$$
  
$$C_2: y^2 + (x^4 + x^3 + x^2 + 1)y = x^7 - 8x^5 - 4x^4 + 18x^3 - 3x^2 - 16x + 8$$

We find a homomorphism (on homology):

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 0 & 0 & 4 \end{pmatrix}$$

#### Consider

 $C: 4x^6 - 54x^5y - 729x^4 + 108x^3y^3 + 39366x^2 - 54xy^5 - 531441 = 0.$ 

From idempotent computations we see for

$$D_2: y^2 = -16x^5 - 40x^4 + 32x^3 + 88x^2 - 32x - 23.$$

there is a degree 3 map  $C \rightarrow D_2$ , but  $Aut(C) = \mathbb{Z}/2$ .

**Construction:** From action of idempotent on tangent space, we can construct a projection from canonical model of C to construct  $D_2$ .

## Example: Prym varieties

Construction of W.P. Milne (1923) associates to a genus 4 curve (e.g.):

$$C: x^{2} + xy + y^{2} + 3xz + z^{2} - yw + w^{2} = xyz + xyw + xzw + yzw = 0$$

a plane quartic:

$$F: 5s^{4} + 28s^{3}t + 28s^{3} + 47s^{2}t^{2} + 76s^{2}t + 44s^{2} + 34st^{3} + 82st^{2} + 66st + 18s + 16t^{4} + 34t^{3} + 32t^{2} + 18t + 1 = 0.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

## **Example: Prym varieties**

Construction of W.P. Milne (1923) associates to a genus 4 curve (e.g.):

$$C: x^{2} + xy + y^{2} + 3xz + z^{2} - yw + w^{2} = xyz + xyw + xzw + yzw = 0$$

a plane quartic:

$$F: 5s^{4} + 28s^{3}t + 28s^{3} + 47s^{2}t^{2} + 76s^{2}t + 44s^{2} + 34st^{3} + 82st^{2} + 66st + 18s + 16t^{4} + 34t^{3} + 32t^{2} + 18t + 1 = 0.$$

Unramified double cover of C:

$$\tilde{D}: u^4 v^4 - 3u^4 v^2 + u^4 - u^3 v^3 - 2u^3 v + u^2 v^2 - u^2 + 3uv^3 + 2uv + v^4 + v^2 + 1 = 0.$$

Numerical computation:  $\operatorname{Jac}(\tilde{D}) \simeq \operatorname{Jac}(F) \times \operatorname{Jac}(C)$ . (consisten with  $\operatorname{Jac}(F)$  being the Prym variety of  $\tilde{D} \to C$ .

## Example usage

```
